# Linear Programming ... in CGAL

- \* **Preamble:** Choice of input type and exact internal number type

```

#include <iostream>
#include <assert>
#include <CGAL/basic.h>
#include <CGAL/QP_models.h>
#include <CGAL/QP_functions.h>

// choose exact integral type
#ifndef CGAL_USE_GMP
#include <CGAL/Gmpz.h>
typedef CGAL::Gmpz ET;
#else
#include <CGAL/MP_Float.h>
typedef CGAL::MP_Float ET;
#endif

// program and solution types
typedef CGAL::Quadratic_program<int> Program;
typedef CGAL::Quadratic_program_solution<ET> Solution;
  
```

for linear and quadratic programs

GMP used internally

Wednesday, November 21, 2012

# Linear Programming ... in CGAL

- \* **Solve:** Call the linear programming solver and output solution

```

// solve the program, using ET as the exact type
Solution s = CGAL::solve_linear_program(lp, ET());
assert (s.solves_linear_program(lp));

// output solution
std::cout << s;
return 0;
}
  
```

independent verification

Wednesday, November 21, 2012

## Linear Programming ... in CGAL

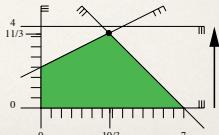

- \* **Solve:** Call the linear programming solver and output solution

```
// solve the program, using ET as the exact type
Solution s = CGAL::solve_linear_program(lp, ETO);
assert (s.solves_linear_program(lp));
```

independent verification

- \* **Output:**

```
status: OPTIMAL
objective value: -160/3
variable values:
  0: 10/3
  1: 11/3
```

$$= \{(x, y) : x^2 + y^2 = \alpha x + \beta y + \gamma\}$$

$$= \{(x, y) : (x - \frac{\alpha}{2})^2 + (y - \frac{\beta}{2})^2 = \gamma + \frac{\alpha^2}{4} + \frac{\beta^2}{4}\}$$

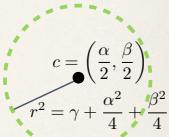

Wednesday, November 21, 2012

# Linear Programming Application I: Cancer Therapy

- Fact: Exposure is possible if and only if the following linear program has positive value.

```
maximize  $\delta$ 
subject to
 $x^2 + y^2 \geq \alpha x + \beta y + \gamma + \delta, \quad (x, y) \in B$ 
 $x^2 + y^2 \leq \alpha x + \beta y + \gamma, \quad (x, y) \in R$ 
```

- Reconstructing the exposure from an optimal solution  $(\alpha, \beta, \gamma, \delta)$ :

$$\begin{aligned} &= \{(x, y) : x^2 + y^2 = \alpha x + \beta y + \gamma\} \\ &= \{(x, y) : (x - \frac{\alpha}{2})^2 + (y - \frac{\beta}{2})^2 = \gamma + \frac{\alpha^2}{4} + \frac{\beta^2}{4}\} \end{aligned}$$

Wednesday, November 21, 2012

# Linear Programming Application I: Cancer Therapy

- Implementation in CGAL: Setup and Solve (Preamble as before)

```
// by default, we have an LP with Ax <= b and no bounds for
// the four variables alpha, beta, gamma, delta
Program lp (CGAL::SMALLER, false, 0, false, 0);
const int alpha = 0;
const int beta = 1;
const int gamma = 2;
const int delta = 3;

// number of red and blue points
int m; std::cin >> m;
int n; std::cin >> n;

// read the red points (cancer cells)
for (int i=0; i<m; ++i) {
    int x; std::cin >> x;
    int y; std::cin >> y;
    // set up <= constraint for point inside/on circle:
    ip.set_a (alpha, m+i, x);
    ip.set_a (beta, m+i, y);
    ip.set_a (gamma, m+i, 1);
    ip.set_a (delta, m+i, 1);
    ip.set_b (m+i, x*x + y*y);
}

// read the blue points (healthy cells)
for (int j=0; j<n; ++j) {
    int x; std::cin >> x;
    int y; std::cin >> y;
    // set up <= constraint for point outside circle:
    ip.set_a (alpha + beta*x + gamma*y, m+j, 1);
    ip.set_a (beta, m+j, y);
    ip.set_a (gamma, m+j, 1);
    ip.set_a (delta, m+j, 1);
    ip.set_b (m+j, x*x + y*y);
}
```

```
// read the blue points (healthy cells)
for (int j=0; j<n; ++j) {
    int x; std::cin >> x;
    int y; std::cin >> y;
    // set up <= constraint for point outside circle:
    ip.set_a (alpha + beta*x + gamma*y, m+j, 1);
    ip.set_a (beta, m+j, y);
    ip.set_a (gamma, m+j, 1);
    ip.set_a (delta, m+j, 1);
    ip.set_b (m+j, x*x + y*y);

    // objective function: -delta (the solver minimizes)
    ip.set_c(delta, -1);

    // enforce a bounded problem:
    ip.set_u (delta, true, 1);

    // solve the program, using ET as the exact type
    Solution s = CGAL::solve_linear_program(lp, ET());
    assert (s.solves_linear_program(lp));
}
```

Wednesday, November 21, 2012

# Linear Programming Application I: Cancer Therapy

- Implementation in CGAL: Output

```
// output exposure center and radius, if they exist
if (s.is_optimal() && (s.objective_value() < 0)) {
    // *opt := alpha, *(opt+1) := beta, *(opt+2) := gamma
    CGAL::Quadratic_program_solution::Variable_value_iterator
        opt = s.variable_values_begin();
    CGAL::Quotient alpha = *opt;
    CGAL::Quotient beta = *(opt+1);
    CGAL::Quotient gamma = *(opt+2);
    std::cout << "There is a valid exposure:\n";
    std::cout << "Center = (" << alpha/2 << ", " << beta/2
    << ")\n";
    std::cout << "Squared Radius = " // gamma + alpha^2/4 + beta^2/4
    << gamma + alpha*alpha/4 + beta*beta/4 << "\n";
} else
    std::cout << "There is no valid exposure.";
std::cout << "\n";
return 0;
}
```

negate resulting value!  
 "Pointer" to first variable of optimal solution  
 The quotient  $*(\text{opt}+i)$  is the value of the variable  $x_i$  in the optimal solution

Wednesday, November 21, 2012

# Linear Programming Application I: Cancer Therapy

- Implementation in CGAL:

$$\begin{array}{lll} \text{minimize} & -\delta & \\ \text{subject to} & x^2 + y^2 \geq \alpha x + \beta y + \gamma + \delta, & (x, y) \in B \\ & x^2 + y^2 \leq \alpha x + \beta y + \gamma, & (x, y) \in R \\ & \delta \leq 1 & \end{array}$$

Avoids unbounded program

maximize  $c^T x \rightarrow \text{minimize } -c^T x$  and negate resulting value

Wednesday, November 21, 2012

# Linear Programming Application I: Cancer Therapy

- Implementation in CGAL: Output

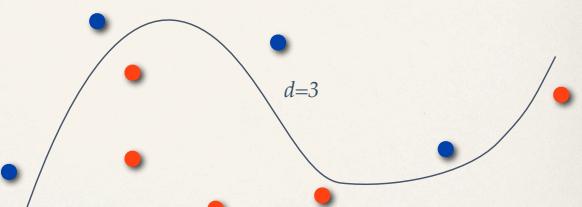

```
// output exposure center and radius, if they exist
if (s.is_optimal() && (s.objective_value() < 0)) {
    // *opt := alpha, *(opt+1) := beta, *(opt+2) := gamma
    CGAL::Quadratic_program_solution::Variable_value_iterator
        opt = s.variable_values_begin();
    CGAL::Quotient alpha = *opt;

# Linear Programming Further Applications

- \* Linear-fractional programming LFP:

$$\begin{array}{ll} \text{minimize} & \frac{c^T x + d}{e^T x + f} \\ \text{subject to} & \begin{array}{lcl} Ax & \geq & b \\ e^T x + f & > & 0 \end{array} \end{array}$$

- \* Reduce to LP through "homogeneous coordinates":

$$\begin{array}{ll} \text{minimize} & c^T y + dz \\ \text{subject to} & \begin{array}{lcl} Ay & \geq & bz \\ e^T y + fz & = & 1 \\ z & \geq & 0 \end{array} \end{array}$$

$y, z$  feasible with value  $t$

$x = \frac{y}{z}$  feasible with value  $t$

# Linear Programming Further Applications

- \* Linear-fractional programming LFP:

$$\begin{array}{ll} \text{minimize} & \frac{c^T x + d}{e^T x + f} \\ \text{subject to} & \begin{array}{lcl} Ax & \geq & b \\ e^T x + f & > & 0 \end{array} \end{array}$$

- \* Reduce to LP through "homogeneous coordinates":

$$\begin{array}{ll} \text{minimize} & c^T y + dz \\ \text{subject to} & \begin{array}{lcl} Ay & \geq & bz \\ e^T y + fz & = & 1 \\ z & \geq & 0 \end{array} \end{array}$$

$z = 0$ : can be handled if LFP is feasible

$x = \frac{y}{z}$  feasible with value  $t$

$y, z$  feasible with value  $t$

# Quadratic Programming: Support Vector Machines

- \* Suppose an optical character recognition needs to distinguish between the letters 'A' and 'B'

- \* Training phase: the system gets to see letters 'A' and 'B' plus the information whether it's an 'A' or a 'B'

Wednesday, November 21, 2012

# Quadratic Programming: Support Vector Machines

- \* Solution: map training letters to points in some high-dimensional space, with label 'A' (blue) or 'B' (red), based e.g. on a pixel-based representation

Wednesday, November 21, 2012

## Quadratic Programming: Support Vector Machines

- Solution: map training letters to points in some high-dimensional space, with label 'A' (blue) or 'B' (red), based e.g. on a pixel-based representation

- Separate the 'A's from the 'B's by a simple shape, for example the *maximum-margin hyperplane* (separating hyperplane of maximum distance to any point).

Wednesday, November 21, 2012

## Quadratic Programming: Support Vector Machines

- Solution: map training letters to points in some high-dimensional space, with label 'A' (blue) or 'B' (red), based e.g. on a pixel-based representation

- Separate the 'A's from the 'B's by a simple shape, for example the *maximum-margin hyperplane* (separating hyperplane of maximum distance to any point). **This is a quadratic program!**

- Classify an unknown letter according to this hyperplane ( $\circlearrowleft$  = 'B')

Wednesday, November 21, 2012

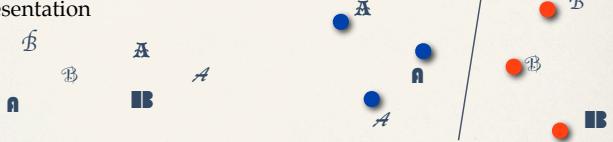

## Quadratic Programming: Support Vector Machines

- Other separating shapes (e.g. spheres as in the cancer therapy application, or zero sets of polynomials) can make sense
- Through lifting, we can often reduce the problem for a given separating shape to the problem of finding the maximum-margin separating hyperplane in some higher (sometimes even infinite-dimensional space). In the end, we just need to solve a quadratic program!
- In the world of support vector machines, the problem of selecting the appropriate separating shape is called *kernel design*.

Wednesday, November 21, 2012

## Quadratic Programming: Support Vector Machines

## Quadratic Programming Application: Low-Risk Investment

- Problem:** How to invest money such that the expected return is maximized but the risk is minimized?

Wednesday, November 21, 2012

# Quadratic Programming Application: Low-Risk Investment

- **Problem:** How to invest money such that the expected return is maximized but the risk is minimized?
- **Fact:** There is no free lunch (= infinite return with no risk), so we have to accept some risk, and/or live with moderate returns.

Wednesday, November 21, 2012

# Quadratic Programming Application: Low-Risk Investment

- **Problem:** How to invest money such that the expected return is maximized but the risk is minimized?
- **Fact:** There is no free lunch (= infinite return with no risk), so we have to accept some risk, and/or live with moderate returns.
- **Risk-averse strategy:** Maximize the expected return under a given upper bound for the risk!
- **Risk-tolerant strategy:** Minimize the risk under a given lower bound for the expected return!

Wednesday, November 21, 2012

# Quadratic Programming Application: Low-Risk Investment

- **Possible investments:**
  - 1,2,...,n (e.g. 1 = Swatch shares, 2 = Credit Suisse shares,...)
- **Investment Characteristics** (not at all easy to know / estimate):
  - $r_i$ : return rate of investment i (assumed to be a random variable)
  - $r_i$ : expected return rate of investment i,  $E[r_i]$
  - $v_i$ : variance ("risk") of  $R_i$ ,  $\text{Var}[R_i] := E[(R_i - E[R_i])^2]$
  - $v_{ij}$ : covariance ("correlation") of  $R_i$  and  $R_j$ ,  $E[(R_i - E[R_i])(R_j - E[R_j])]$

$$v_{ii} = v_i$$

Wednesday, November 21, 2012

  - $v_{ij}$ : covariance ("correlation") of  $R_i$  and  $R_j$ ,  $E[(R_i - E[R_i])(R_j - E[R_j])]$

Wednesday, November 21, 2012

# Quadratic Programming Application: Low-Risk Investment

- **Example: n=2**

	$r_i$	
Swatch shares	10% (0.1)	
		Credit Suisse shares
Swatch shares	0.09	-0.05
Credit Suisse shares	-0.05	0.25

Wednesday, November 21, 2012

## Quadratic Programming Application: Low-Risk Investment

- \* Example:  $n=2$

	$r_i$
Swatch shares	10% (0.1)
Credit Suisse shares	51% (0.51)

$v_{ij}$	Swatch shares	Credit Suisse shares
Swatch shares	0.09	-0.05
Credit Suisse shares	-0.05	0.25

Negative correlation: if CS does worse than expected, Swatch will probably do better, and vice versa

Wednesday, November 21, 2012

## Quadratic Programming Application: Low-Risk Investment

- \* Investment strategy:

$$(x_1, x_2, \dots, x_n), \quad \sum_{i=1}^n x_i = 1, \quad x_i \geq 0 \forall i$$

Meaning: An  $x_i$  fraction of your money goes into investment  $i$

## Quadratic Programming Application: Low-Risk Investment

- \* Example:  $n=2$

	$r_i$
Swatch shares	10% (0.1)
Credit Suisse shares	51% (0.51)

$v_{ij}$	Swatch shares	Credit Suisse shares
Swatch shares	0.09	-0.05
Credit Suisse shares	-0.05	0.25

Read as: standard deviation of return rate is  $\sqrt{0.25} = 0.5$  (actual return rate could easily be off by 0.5)

Wednesday, November 21, 2012

Wednesday, November 21, 2012

## Quadratic Programming Application: Low-Risk Investment

- \* Investment strategy:

$$(x_1, x_2, \dots, x_n), \quad \sum_{i=1}^n x_i = 1, \quad x_i \geq 0 \forall i$$

Meaning: An  $x_i$  fraction of your money goes into investment  $i$

- \* Expected return rate of this strategy:

$$E[\sum_{i=1}^n x_i R_i] = \sum_{i=1}^n x_i E[R_i] = \sum_{i=1}^n r_i x_i$$

- \* Example: half the money in Swatch shares, half in Credit Suisse shares; expected return rate is  $\frac{1}{2} \cdot 0.1 + \frac{1}{2} \cdot 0.51 = 0.305 = 30.5\%$

Wednesday, November 21, 2012

## Quadratic Programming Application: Low-Risk Investment

- \* Investment strategy:

$$(x_1, x_2, \dots, x_n), \quad \sum_{i=1}^n x_i = 1, \quad x_i \geq 0 \forall i$$

Meaning: An  $x_i$  fraction of your money goes into investment  $i$

- \* Risk of this strategy:

$$\text{Straightforward calculations}$$

$$\text{Var}[\sum_{i=1}^n x_i R_i] = \sum_{i=1}^n \sum_{j=1}^n v_{ij} x_i x_j = x^T D x$$

$D = (v_{ij})_{1 \leq i,j \leq n}$  is the covariance matrix

Wednesday, November 21, 2012

Wednesday, November 21, 2012

# Quadratic Programming Application: Low-Risk Investment

- \* **Investment strategy:**

$$(x_1, x_2, \dots, x_n), \quad \sum_{i=1}^n x_i = 1, \quad x_i \geq 0 \forall i$$

Meaning: An  $x_i$  fraction of your money goes into investment  $i$

- \* **Risk of this strategy:**

$$\text{Var} \left[ \sum_{i=1}^n x_i R_i \right] = \sum_{i=1}^n \sum_{j=1}^n v_{ij} x_i x_j = x^T D x$$

$D = (v_{ij})_{1 \leq i,j \leq n}$  is the covariance matrix

- \* **Example:** half-half Swatch/CS has risk  $\frac{0.09 - 2 \cdot 0.05 + 0.25}{4} = 0.06$

Wednesday, November 21, 2012

# Quadratic Programming Application: Low-Risk Investment

- \* **The risk-tolerant case:** Find the investment strategy with lowest risk that guarantees expected return rate at least  $\rho$ !

$$\begin{aligned} & \text{minimize} \quad \sum_{i=1}^n \sum_{j=1}^n v_{ij} x_i x_j \leftarrow \boxed{\text{risk}} \\ & \text{subject to} \quad \sum_{i=1}^n r_i x_i \geq \rho \quad \boxed{\text{expected return rate}} \\ & \quad \boxed{\text{strategy}} \quad \sum_{i=1}^n x_i = 1 \\ & \quad \quad \quad x_i \geq 0, \quad i = 1, \dots, n \end{aligned}$$

Wednesday, November 21, 2012

# Quadratic Programming Application: Low-Risk Investment

- \* **The risk-tolerant case:** Find the investment strategy with lowest risk that guarantees expected return rate at least  $\rho$ !

$$\begin{aligned} & \text{minimize} \quad \sum_{i=1}^n \sum_{j=1}^n v_{ij} x_i x_j \leftarrow \boxed{\text{risk}} \\ & \text{subject to} \quad \sum_{i=1}^n r_i x_i \geq \rho \quad \boxed{\text{expected return rate}} \\ & \quad \boxed{\text{strategy}} \quad \sum_{i=1}^n x_i = 1 \\ & \quad \quad \quad x_i \geq 0, \quad i = 1, \dots, n \end{aligned}$$

- \* **Example:**  $\rho = 0.4$ : 26.8% Swatch, 73.2% Credit Suisse; risk = 0.121

Wednesday, November 21, 2012

# Quadratic Programming Application: Low-Risk Investment

- \* **Investment strategy:**

$$(x_1, x_2, \dots, x_n), \quad \sum_{i=1}^n x_i = 1, \quad x_i \geq 0 \forall i$$

Meaning: An  $x_i$  fraction of your money goes into investment  $i$

- \* **Risk of this strategy:**

$$\text{Var} \left[ \sum_{i=1}^n x_i R_i \right] = \sum_{i=1}^n \sum_{j=1}^n v_{ij} x_i x_j = x^T D x$$

$D = (v_{ij})_{1 \leq i,j \leq n}$  is the covariance matrix

less than each individual risk!

- \* **Example:** half-half Swatch/CS has risk  $\frac{0.09 - 2 \cdot 0.05 + 0.25}{4} = 0.06$

Wednesday, November 21, 2012

# Quadratic Programming Application: Low-Risk Investment

- \* **The risk-tolerant case:** Find the investment strategy with lowest risk that guarantees expected return rate at least  $\rho$ !

$$\begin{aligned} & \text{minimize} \quad \sum_{i=1}^n \sum_{j=1}^n v_{ij} x_i x_j \leftarrow \boxed{\text{risk}} \\ & \text{subject to} \quad \sum_{i=1}^n r_i x_i \geq \rho \quad \boxed{\text{expected return rate}} \\ & \quad \boxed{\text{strategy}} \quad \sum_{i=1}^n x_i = 1 \\ & \quad \quad \quad x_i \geq 0, \quad i = 1, \dots, n \end{aligned}$$

**Fact:** the covariance matrix is positive semidefinite, so this is indeed a convex QP.

Wednesday, November 21, 2012

# Low-Risk Investment Example ... in CGAL

- \* **Preamble:** This time, it's floating-point input...

Gnu  
Multi-precision  
Library  
(GMP)  
  
CGAL

```
#include <iostream>
#include <cassert>
#include <CGAL/basic.h>
#include <CGAL/QP_models.h>
#include <CGAL/QP_functions.h>

// choose exact floating-point type
#ifndef CGAL_USE_GMP
#include <CGAL/Gmpzf.h>
typedef CGAL::Gmpzf ET;
#else
#include <CGAL/MP_Float.h>
typedef CGAL::MP_Float ET;
#endif

// program and solution types
typedef CGAL::Quadratic_program<double> Program;
typedef CGAL::Quadratic_program_solution<ET> Solution;
```

Wednesday, November 21, 2012

## Low-Risk Investment Example ... in CGAL

- \* **Input:** Desired expected return

```
int main() {
    // read minimum expected return rate
    std::cout << "What is your desired expected return rate? ";
    double rho; std::cin >> rho;
```

for example, 0.4 = 40%

Wednesday, November 21, 2012

## Low-Risk Investment Example ... in CGAL

- \* **Solve:** ...as nonnegative quadratic program (a little faster)

```
// solve the program, using ET as the exact type
Solution s = CGAL::solve_nonnegative_quadratic_program(qp, ETO);
assert(s.solves_quadratic_program(qp));
```

independent verification

Wednesday, November 21, 2012

## Low-Risk Investment Example ... in CGAL

- \* **Setup:** Make sure to enter matrix 2D (customary in QP solvers)! 

```
// by default, we have a nonnegative QP with Ax >= b
Program qp (CGAL::LARGER, true, 0, false, 0);

// now set the non-default entries:
const int sw = 0;
const int cs = 1;

// constraint on expected return: 0.1 sw + 0.51 cs >= rho
qp.set_a(sw, 0, 0.1);
qp.set_a(cs, 0, 0.51);
qp.set_b(0, rho);

// strategy constraint: sw + cs = 1
qp.set_a(sw, 1, 1);
qp.set_a(cs, 1, 1);
qp.set_b(1, 1);
qp.set_r(1, CGAL::EQUAL); // override default >=
```

// objective function: 0.09 sw^2 - 0.1 sw cs - 0.1 cs sw + 0.25 cs^2
// we need to specify the entries of the symmetric matrix 2D, on and below the diagonal
qp.set\_d(sw, sw, 0.18); // 0.09 sw^2
qp.set\_d(cs, sw, -0.10); // -0.05 cs sw
qp.set\_d(cs, cs, 0.25); // 0.25 cs^2

 j ≤ i in **set\_d** (i, j)

Wednesday, November 21, 2012

## Low-Risk Investment Example ... in CGAL

- \* **Output:** query programming status; if feasible, output strategy/risk

```
// output
if (s.status() == CGAL::QP_INFEASIBLE) {
    std::cout << "Expected return rate " << rho << " cannot be achieved.\n";
} else {
    assert (s.status() == CGAL::QP_OPTIMAL);
